Reduction, expanded

ND2D path (hearing → Deaf) · code: slm_pipeline.py → reduction()

Real examples (run through our code)

Hearing person says	After Normalization	Kept by Reduction	Thrown away	Deaf person's screen
“Where is your mom, darling?”	where is your mother darling	**where is your mother**	darling (Rule 1)	**where mother**
“Hey, are you going to school tomorrow?”	hello are you going to school tomorrow	**hello are you going to school tomorrow**	nothing	**hello you school tomorrow**
“Wow, amazing!”	wow amazing	**(nothing)**	wow, amazing (Rule 1) → Rule 4 stops	**(empty)**
“Okay so my mother and my father and my teacher and my friend and my family are all at home today eating”	okay so my mother and … are all at home today eating (22 words)	**okay so my mother and my father and my teacher and my friend and my family (16)**	all (Rule 1); are at home today eating (Rule 3)	**friend mother teacher family father**

Example 2: every word is in the lookup table, so Reduction keeps all of them; “are”, “going”, “to” are removed later by Space Restriction because they have no sign. Example 4: Rule 3 cuts a long sentence after its 16th word, so “home today eating” is lost. This is a current limit of the model (16 positions).
